

Week 1 Report

HTML & CSS Foundations

Name	Ayesha
Internship	NexaSecure Tech
Duration	Week 1 — 7 Days
Email	ayeshaarshiya234@gmail.com
Location	Karachi, Pakistan
GitHub	github.com/Ayesha352

Submitted as part of Web Development Internship Program — 2026

Table of Contents

1. Cover Letter	3
2. Day 1 — HTML & Semantic Structure	4
3. Day 2 — HTML Forms & Media	4
4. Day 3 — CSS Basics	5
5. Day 4 — CSS Flexbox	5
6. Day 5 — Responsive Landing Page	6
7. Day 6 — Portfolio Website Part 1	6
8. Day 7 — Portfolio Website Part 2	7
9. Weekly Summary & Reflection	7

Cover Letter

April 2026

To Whom It May Concern,

My name is Ayesha and I am a web development intern at NexaSecure Tech. This is my Week 1 report where I have documented everything I learned and built during these 7 days.

Honestly, this week was a lot to take in. I started from the very beginning — learning what HTML even is — and by Day 7 I had built my own portfolio website. The thing that took me the most time was CSS styling. I kept trying to get the colors and spacing right and sometimes it just would not look the way I wanted. But I kept trying and eventually things started to make sense.

I also learned GitHub this week which was new for me. Uploading files and committing changes felt confusing at first but now I am more comfortable with it.

I am glad I pushed through the difficult parts. I feel like I learned a lot in just one week and I am looking forward to Week 2.

Sincerely,

Ayesha

Web Development Intern — NexaSecure Tech

Day 1 — HTML & Semantic Structure

Task

Learn HTML tags and page structure, practice headings, paragraphs, lists and links.

What I Did

I started by learning what HTML actually is and how a webpage is structured. I practiced writing headings from h1 to h6, paragraphs, unordered and ordered lists, and different types of links like external links, email links and links that jump to sections on the same page.

My Experience

At first I kept forgetting to close my tags properly. I made quite a few mistakes but fixing them helped me understand how HTML works.

Deliverable

✓ Code examples uploaded to GitHub repository.

Day 2 — HTML Forms & Media

Task

Add forms with inputs and buttons. Embed images and videos in a webpage.

What I Did

I learned how to create forms with different input types like text, email, password and date. I also added a submit button and practiced embedding an image and a YouTube video into a page.

My Experience

The form part was fine but embedding media took me some time to figure out. I did not know you could just paste an iframe for videos — that was actually pretty cool.

Deliverable

✓ Form demonstration screenshot uploaded to GitHub.

Day 3 — CSS Basics

Task

Learn box model, selectors, colors and fonts. Style a sample HTML page.

What I Did

This was the day I started styling pages. I learned about CSS selectors, how to change colors and fonts, and the box model — which explains margin, padding and border around elements.

My Experience

CSS was harder than HTML for me. I spent a long time trying to get the spacing right. Sometimes I changed one thing and something else would break. But slowly I got used to it.

Deliverable

✓ CSS file with comments uploaded to GitHub.

Day 4 — CSS Flexbox

Task

Create flexible layouts using Flexbox. Practice alignment and spacing.

What I Did

I learned CSS Flexbox which makes it much easier to align things on a page. I practiced using justify-content, align-items and flex-direction to create different layouts.

My Experience

Flexbox was actually easier than I expected once I understood the main concept. I practiced by building a simple card layout and a navigation bar.

Deliverable

✓ Flexbox practice project committed to GitHub.

Day 5 — Responsive Landing Page

Task

Build a responsive landing page using HTML and CSS.

What I Did

I built a complete landing page that works on both desktop and mobile. I used media queries to make the layout change depending on the screen size.

My Experience

This was the first time I built something that actually looked like a real website. I felt good about it even though the CSS took a while.

Deliverable

✓ Landing page project uploaded with screenshots.

Day 6 — Portfolio Website Part 1

Task

Structure the HTML and apply basic CSS styling for personal portfolio.

What I Did

I started building my personal portfolio website. I created the HTML structure with sections for Home, About, Skills, Projects and Contact. Then I started applying CSS to style each section.

My Experience

The hardest part was getting the hero section to look right. The image and text positioning took me multiple tries.

Deliverable

✓ Initial portfolio code committed to GitHub.

Day 7 — Portfolio Website Part 2

Task

Make the portfolio responsive and polished. Review the overall design.

What I Did

I added media queries to make the portfolio work on mobile screens. I also went through the whole website and fixed small design issues like font sizes, spacing and button alignment.

My Experience

Reviewing my own design was actually helpful. I noticed things I had not seen before like a button that was not aligned properly and some text that was hard to read on smaller screens.

Deliverable

✓ Completed portfolio uploaded with README and screenshots.

Weekly Summary & Reflection

What I Built This Week

Day	Project
Day 1	HTML practice page with headings, lists and links
Day 2	HTML form with inputs, buttons and embedded media
Day 3	Styled sample page using CSS basics
Day 4	Flexbox layout practice project
Day 5	Responsive landing page
Day 6-7	Complete personal portfolio website

Overall Reflection

Week 1 was challenging but I learned more than I expected. The hardest part for me was CSS styling — getting things to look exactly how I wanted took a lot of trial and error. But that is also how I learned the most.

By the end of the week I had a working portfolio website with my name, my skills and my projects on it. That felt really good. A week ago I did not know how to write a single line of HTML.

I am excited for Week 2 and I plan to keep practicing every day.
